

Hot asphalt recycling

Martins Zaumanis

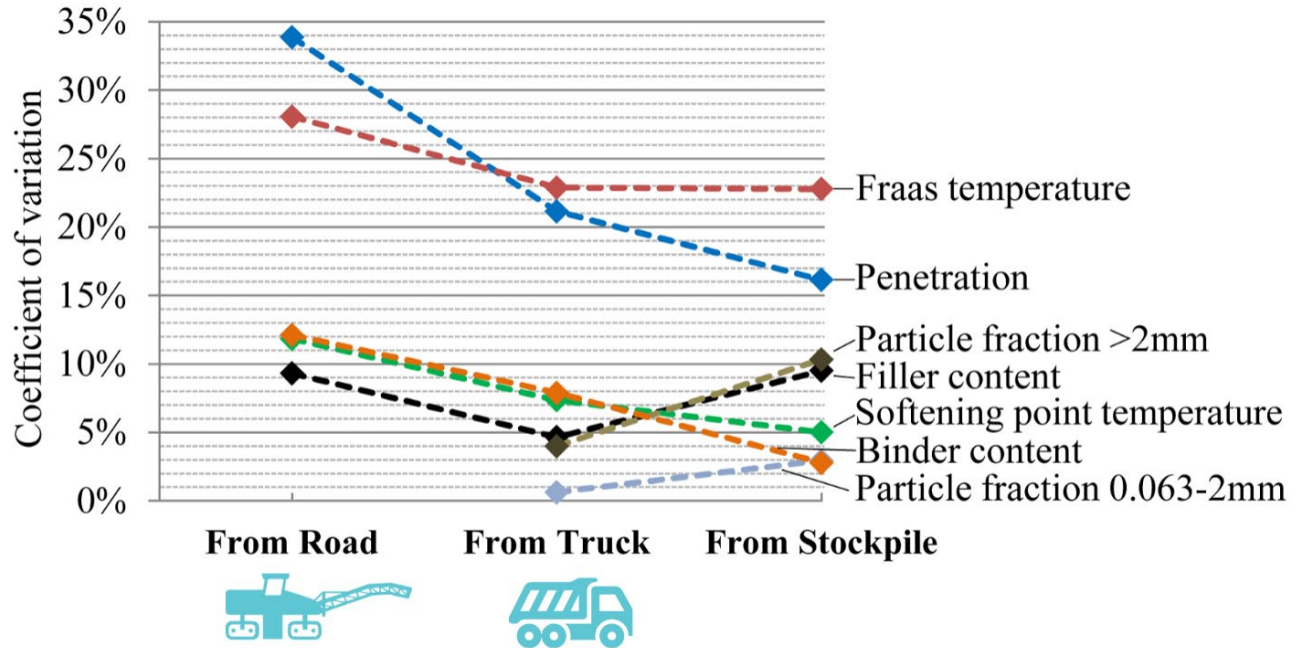

ART 2024, 9th of September, 2024

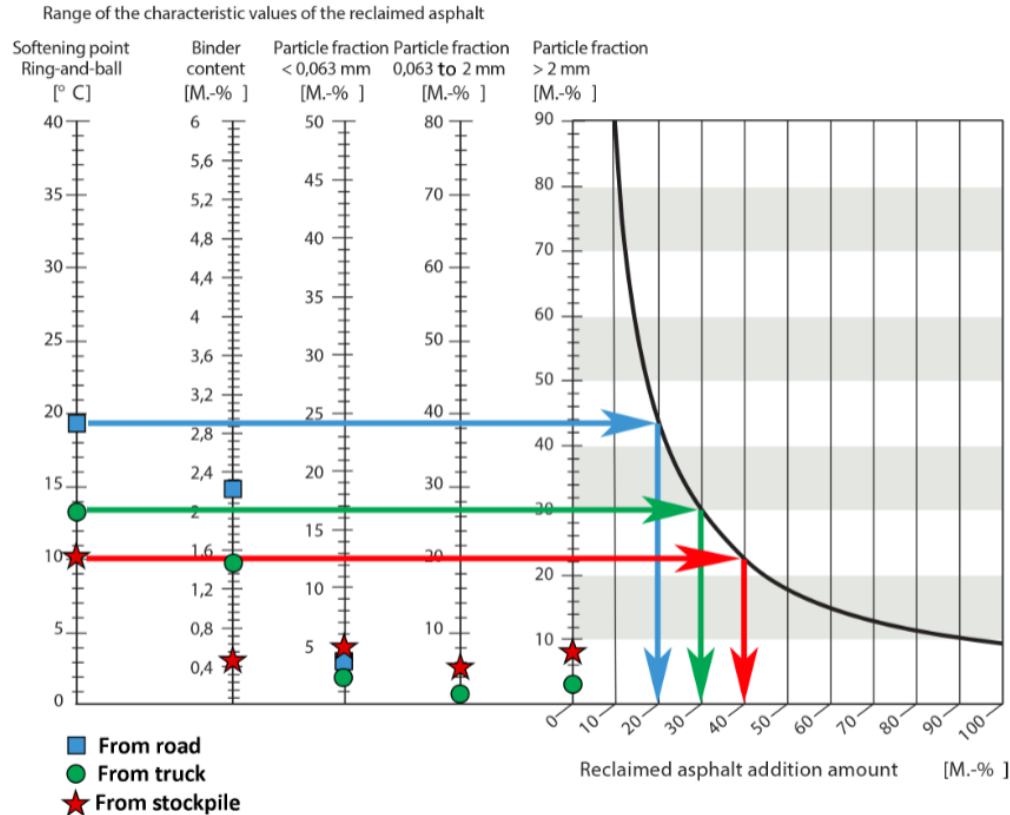

Reclaimed asphalt homogeneity

Paper: How to reduce reclaimed asphalt variability: A full-scale study

The variability of RAP can be reduced

The variability of RAP can be reduced

Asphalt milling

Paper: Impact of milling machine parameters on the properties of reclaimed asphalt pavement

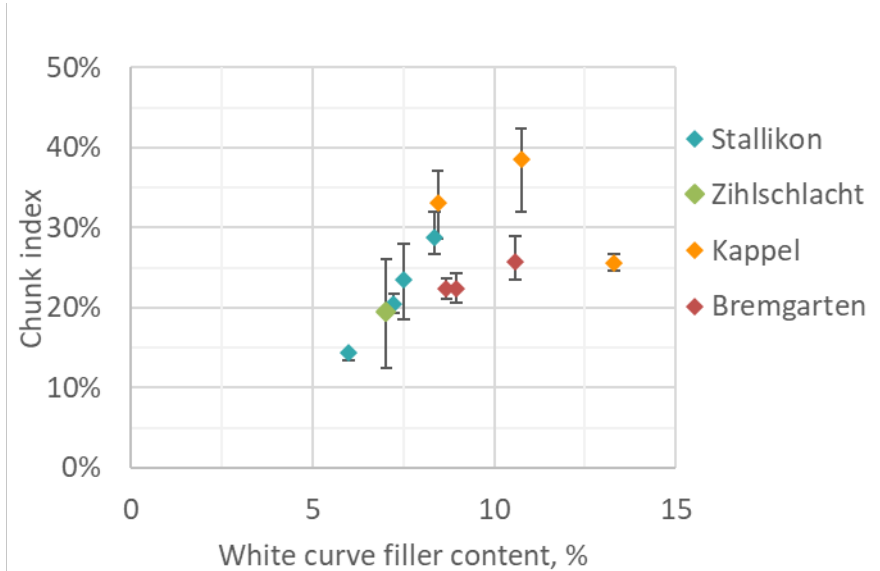

Milling parameters impact the RAP properties. But which parameters and how?

The size of RAP agglomerations increase with higher milling speed

Less filler is generated at lower milling speed

RAP processing

Paper: Three indexes to characterise crushing and screening of reclaimed asphalt pavement

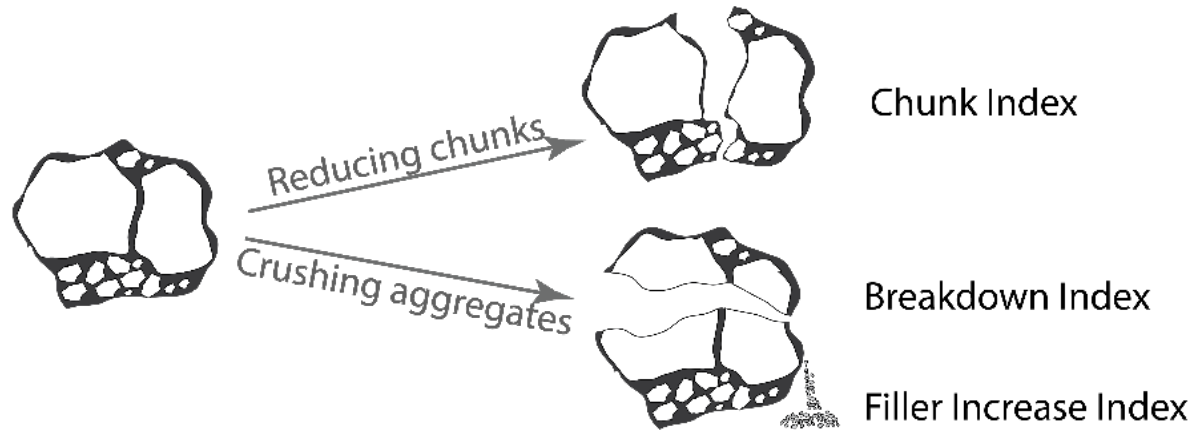

Four different crushers were used for the experiment

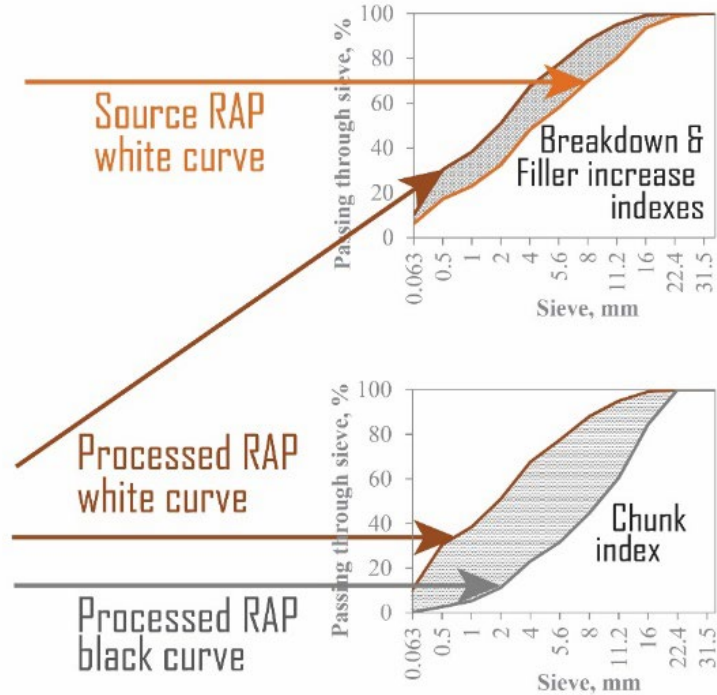

Three indexes that allow evaluating crushing and screening of RAP were developed:

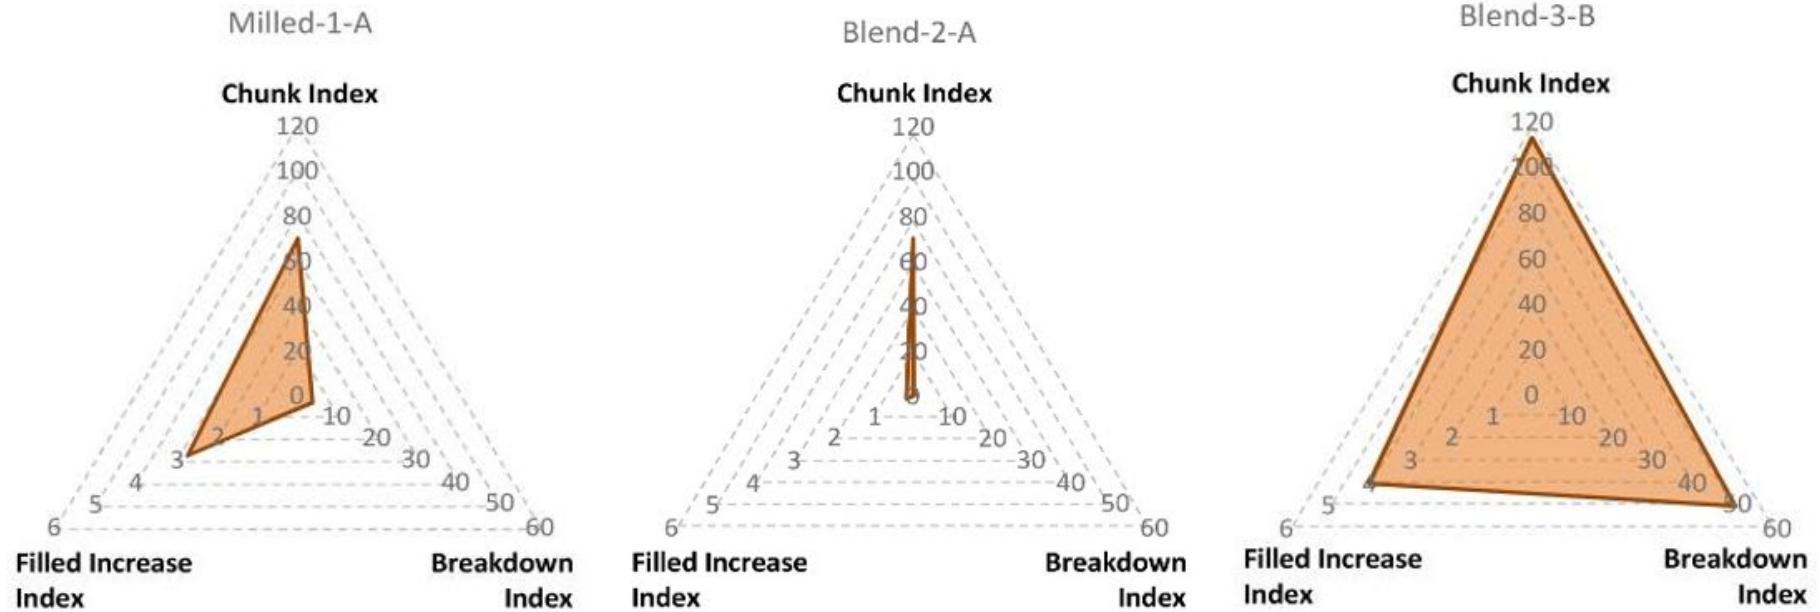

- **Chunk Index** demonstrates the size of RAP agglomerations.
- **Breakdown Index** demonstrates the reduction of RAP aggregate particle size during processing.
- **Filler Increase Index** reflects the amount of generated filler content during RAP processing.

The indexes can be determined using gradation analysis of RAP before and after binder extraction.

A radar chart allows comparing different RAP crushing methods and optimize the crusher parameters

Smaller area = better RAP processing

Calculator is available for download:

<https://doi.org/10.5281/zenodo.5500154>

Instructions:

- Change the sieve sizes in the "Source black curve", if necessary.
- Fill the green cells with data (delete the example data first).
- The calculated indexes as well as their graphical representation will appear on the right.
- If you notice any errors, please inform Martins Zaumanis (gedkabs@gmail.com)

Rejuvenators

Papers: 100% recycled high-modulus asphalt concrete mixture design and validation using vehicle simulator

Determining optimum rejuvenator dose for asphalt recycling based on Superpave performance grade specifications

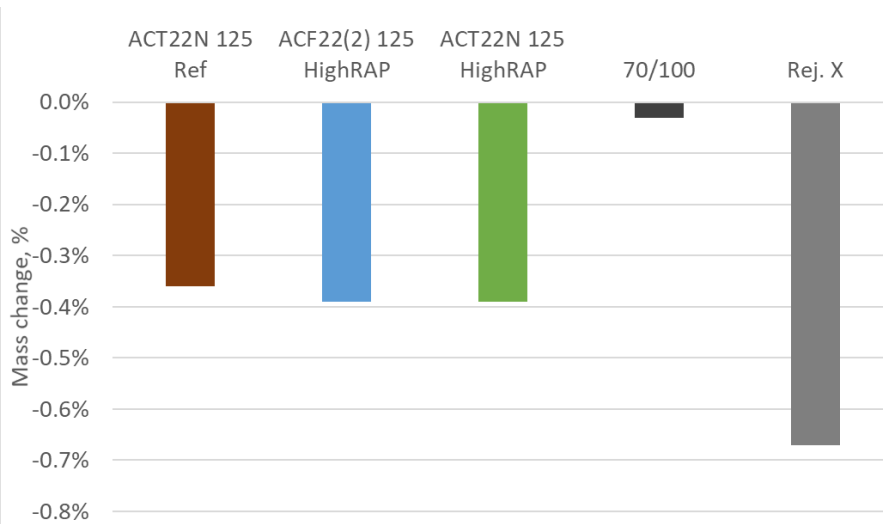

Step 1: Rejuvenator dosage to reach the penetration of target grade

$$Dose = \frac{\log_e \frac{PEN}{A}}{B}$$

Step 2: Determine aging resistance

1) Mass change after RTFO aging

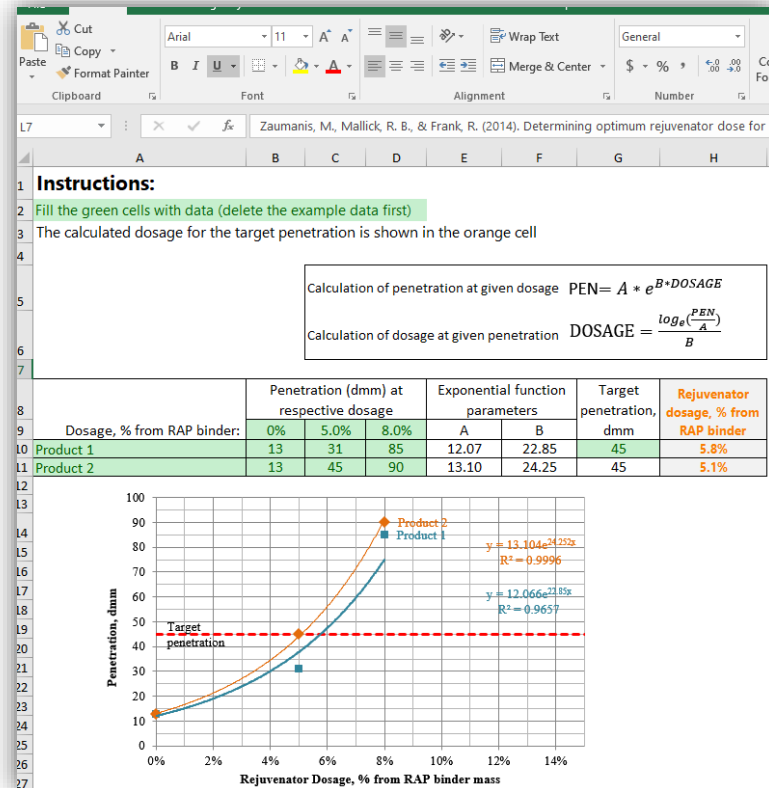

2) Penetration after RTFO + 2PAV

Calculator for determining dosage:

<https://doi.org/10.5281/zenodo.7441805>

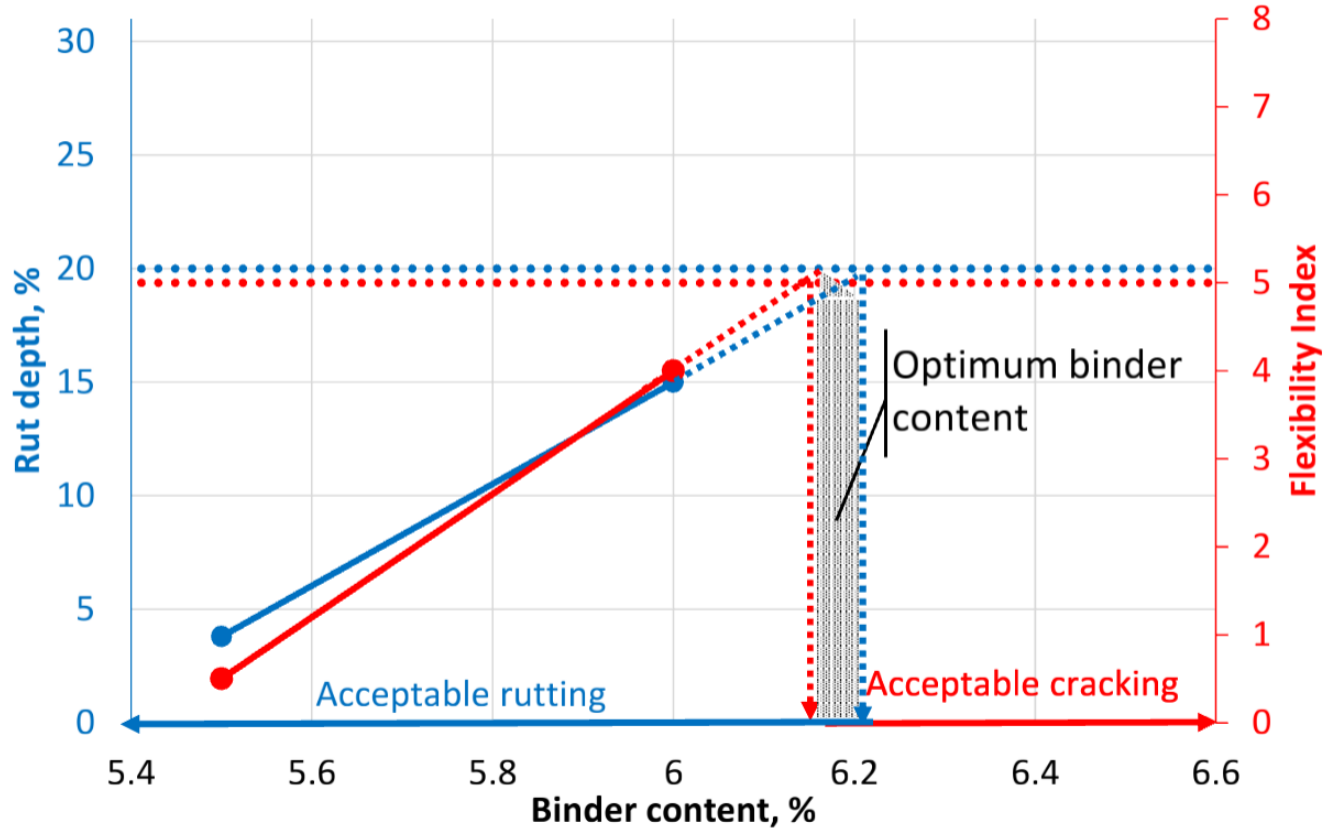

Balanced mix design

Papers: Performance-based design of 100% recycled hot-mix asphalt and validation using traffic load simulator

The test methods for balanced mix design should be carefully selected

Optimization of binder content

Rejuvenator addition in asphalt plant

Papers: Determining optimum rejuvenator addition location in asphalt production plant

Effect of rejuvenator addition location in plant on mechanical and chemical properties of RAP binder

A rejuvenator can be added in different locations

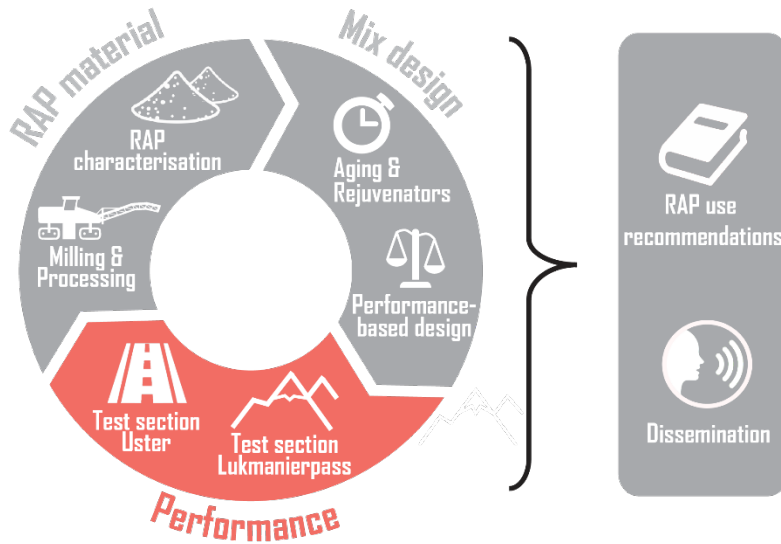

"Effect of rejuvenator addition location in plant on mechanical and chemical properties of RAP binder"

A rejuvenator can be added in different locations

Addition location	Environment		Operation		Quality
